

## Headlight Accessory Kit Installation Guide

Once the headlight buckets are complete and the LEDs wires have been pushed out of the holes it's time to hook up the plugs to connect it to the main harness.

1. The First step is to push the wires into the slots. Because the wire is a thin gauge of wire, a small screwdriver on the edge of the terminal can help guide it through. Make sure the Black wires match up which will take care of the different color combinations on the other pin.

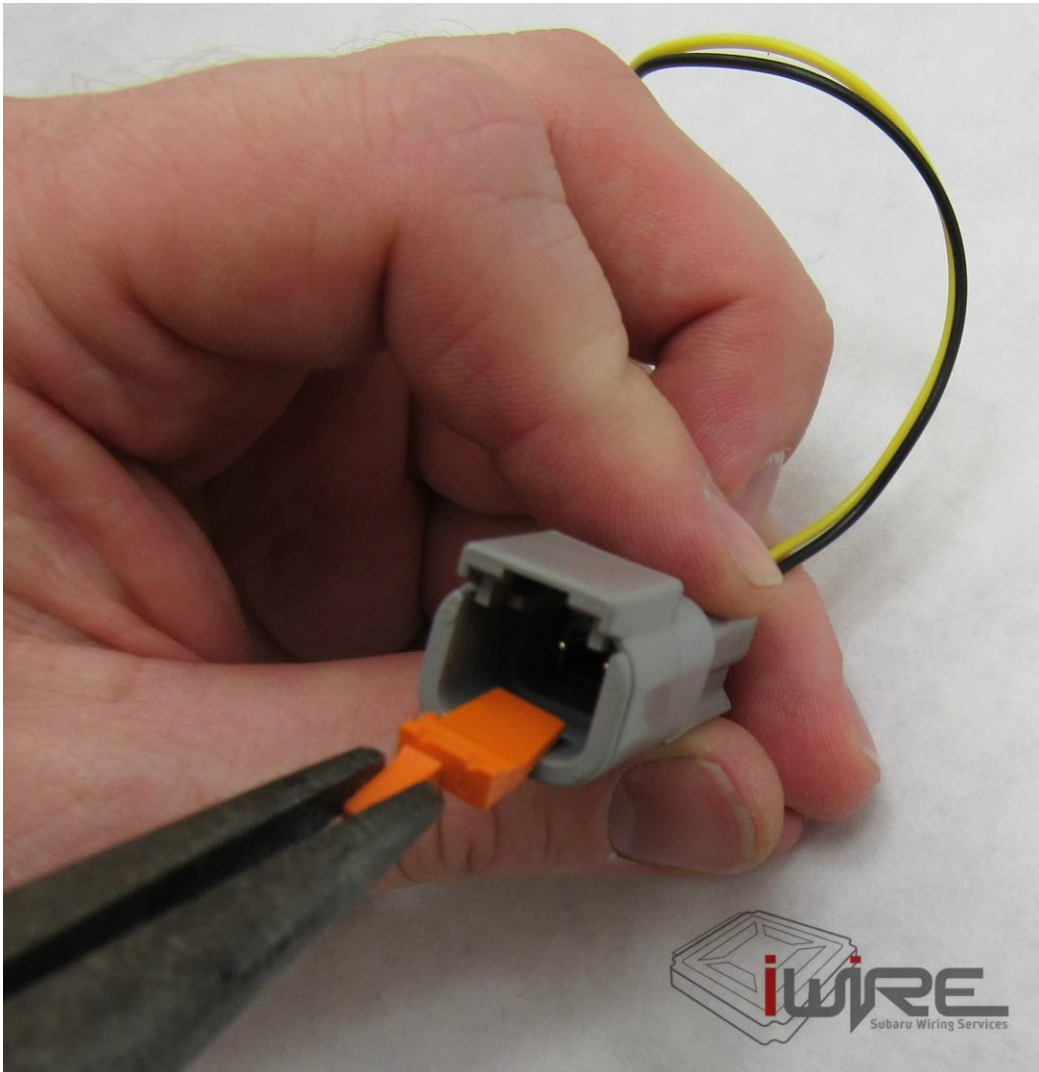

2.

3.

4. Make sure the pins are seated, then install the wedgelock to hold the pins in place.

5.

6. Same process for the other style connector.

7.

8.

9. Final connections should look like this.
